Time Management for System Administrators
by Morty Abzug, in Book Reviews - Sat, Apr 8th 2006 00:00 PDT

Time Management for System Administrators contains useful advice for SysAdmins looking to use their time more effectively. If you are a techie who wonders why you get bogged down with little tasks while not getting your projects done, this is the book for you. If you don't have the time to read this book, you definitely need to read it.

DbVisualizer 5.0
by Roger Bj�revall - Sat, Apr 8th 2006 02:17 PDT

About: DbVisualizer is a feature rich and intuitive cross platform database tool for developers and DBAs that provides a single, powerful interface for a variety of databases. It supports simultaneous database connection and lets you explore and manage database objects, execute SQL queries, visualize information, and a lot more.

Changes: This version adds support for SQL Server 2005, Sybase 15, and explain plan for Oracle, DB2 and SQL Server. A universal binary installer was provided for Mac OS X on Intel along with a PL/SQL editor and compiler for Oracle and full key binding support with pre-defined key maps.

ObfuscateJS 0.3.1
by [Michiel van Vlaardingen](#) - Sat, Apr 8th 2006 01:47 PDT

About: ObfuscateJS is a command line JavaScript obfuscator. It strips comments and unneeded whitespace, shortens local variable names, and shortens variable names with a given prefix (e.g. "_"). ObfuscateJS can be used for libraries because it preserves the API.

Changes: A bug with scripts that use the Function constructor to create functions was fixed.

logtail 0.2-SNAPSHOT-build48
by [Thomas Peuss](#) - Sat, Apr 8th 2006 01:45 PDT

About: logtail is an AJAX-based logfile download and viewing application. The logfiles are displayed like in the popular Unix "tail" program. Due to the AJAX approach, only the changed lines in a logfile are transferred from the server.

Changes: This build fixes many little bugs and has some new features, including a profile in the pom.xml file for publishing the build artifacts to the Luntbuild artifact directory, the inclusion of a dependency on JSTL in the Maven build file, and code to limit the log lines in a tailing window to a given number.

Agatha 0.7.1 (Unix)
by JimmyDigital - Sat, Apr 8th 2006 01:13 PDT

About: Agatha is a Web-based MP3 playing system that allows the home user or office group to stream music, create, manage, and share play lists, and control the playing of music on a remote system. It does not require a database and has full play-on-server support.

Changes: A few bugs in the local play feature were fixed. The documentation was updated to deal with a common socket issue.

PHP backended by a MySQL database. It includes features such as posting/replying/editing messages, private messages, private forums, user and anonymous posting, robust theming, user ranking by posts or by special, admin definable, ranks, and much more.

Changes: This release is a cumulative bugfix update that also includes a number of minor security fixes. A new feature that allows you to limit how often a user may conduct a search if you find that searches are putting a load on your server was added. The default permissions on new forums were changed so that you must explicitly make them available for guests to post in and visual confirmation was enabled by default on all new installs.

Snes9x Python Launcher 1.0 beta
by Sean Reece - Sat, Apr 8th 2006 01:12 PDT

About: The Snes9x Python Launcher is a terminal/text-based frontend for the Snes9x emulator. Planned features include enabling all command line switches for Snes9x and support for multiple directories.

Changes: Support for almost all of the command line switches concerning graphics and sound was added. Hires, transparency, mode switch, and frame rate display have not yet been enabled for graphics, and sound buffer size, master volume, and alternate sample decoding method have not yet been enabled for sound.

Open Tax Solver 0.5 (GUI)
by Aston Roberts - Sat, Apr 8th 2006 01:12 PDT

About: OTS is an easy program for calculating personal income tax form entries and taxes-owed or refund due. It handles forms such as US-Fed-1040, with forms A, B, C, D, AMT worksheets, and state income taxes, as well as Canada and UK income taxes.

Changes: A convenient pull-down menu was added to the GUI for selecting filing status. A quit-warning pop-up was added to avoid accidental exits. A bug in the comment editor was fixed. The GUI was made to tolerate a wider range of file name options. The graphical frontend for OTS tax solver programs is optional but convenient for entry and editing of tax data, and calculation of taxes on all platforms. OTS can always be used in pure text mode with

debian-multimirror 2.5
by Pedro Larroy - Sat, Apr 8th 2006 01:10 PDT

About: debian-multimirror is a tool that eases and automates the creation and maintenance of custom Debian mirrors by mirroring only what you need. You can choose what packages to mirror, and include or exclude them based in regular expressions. It uses parallel programming to exploit redundancy between mirrors and download from several mirrors at the same time for best performance and less mirror load. A custom algorithm is used to select a consistent set of packages, and out of sync or even broken mirrors can still be used. SHA1 and MD5 package information is used to assure data integrity. It uses an XML file for configuration of the local mirror, and writes the correspondent "Package" files after finishing mirroring.

Changes: There is now support for signing Release files with gpg.

Categories	Focus	License	URLs
Internet System :: Archiving :: Mirroring	Minor feature enhancements	GNU General Public License (GPL)	

Construct 1.20
by ganges master - Sat, Apr 8th 2006 01:10 PDT

About: Construct is a Python library for declaratively defining arbitrary data structures, called "constructs". These constructs can both parse data into an object or build an object into data. Constructs work at the bit-level, so there are no issues with byte-alignment. It supports fields, structs, unions, and repeaters; adapters and validators; switches, pointers, and other meta-constructs, like TLVs. Many primitives are provided, as well as an "inventory" of ready-made protocols and file format parsers.

Changes: Formatted, Float32/64 (both parsing and building), and FlagsAdapter were added. LV, PascalString, and Flag were improved. The utils package and PascalStringAdapter were removed.

When 1.0.24
by Ben Crowell - Fri, Apr 7th 2006 17:35 PDT

About: When is an extremely simple personal calendar program, aimed at the Unix geek who wants something minimalistic. It can keep track of things you need to do on particular dates. It's a very short and simple program, so you can easily tinker with it yourself. It doesn't depend on any libraries, so it's easy to install. You should be able to install it on any system where Perl is available, even if you don't have privileges for installing libraries. Its file format is a simple text file, which you can edit in your favorite editor.

Changes: There is improved error handling for dates that are formatted incorrectly.

Categories	Focus	License	URLs
Office/Business :: Scheduling	Minor feature enhancements	Perl License	

Divmod Nevow 0.8.0
by Jean-Paul Calderone - Fri, Apr 7th 2006 17:35 PDT

About: Nevow is a Web application construction kit. It is designed to allow the programmer to express as much of the view logic as desired in Python, and includes a pure Python XML expression syntax, named stan, to facilitate this. It also provides rich support for designer-edited templates, using a very small XML attribute language to provide bi-directional template manipulation capability.

Changes: This release adds Nevow Interactive Tests (nit), a test runner that lets you exercise code in a browser and collect results in an structured manner, the ability to see JavaScript source lines in tracebacks logged on the server, a JavaScript implementation of DeferredList and gatherResults from Twisted, direct use of the Zope Interface (meaning everything will be faster from avoiding the compatibility layer provided by Twisted), and transparent, structured argument passing for Widget.__init__.

Open MPI 1.0.2
by Jeff Squyres - Fri, Apr 7th 2006 17:33 PDT

About: Open MPI is a project that originated as the merging of technologies and resources from several other projects (FT- MPI, LA-MPI, LAM/MPI, and PACX-MPI) in order to build the best MPI library available. A completely new MPI-2 compliant implementation, Open MPI offers advantages for system and software vendors, application developers, and computer science researchers. It is easy to use, and runs natively on a wide variety of operating systems, network interconnects, and batch/scheduling systems.

Changes: Many bugfixes, including fixes to MPI interface functions (C, C++, F77, and F90), updates to support various compilers and platforms, various mVAPI and OpenIB feature and correctness fixes, I/O forwarding fixes, an updates to the algorithm to search for executables on remote nodes. The newest version of ROMIO is included.

TrueMusic 20060407
by rmacnak - Fri, Apr 7th 2006 17:30 PDT

About: TrueMusic is a simple pure Java music player that supports MP3 and WAV (and AIF without seeking). The GUI attempts to mimic the native look and feel of the running environment. It requires JRE 1.5.x.

Changes: This release adds tag editing support.

Categories	Focus	License	URLs
Multimedia :: Sound/Audio :: Players :: MP3	Minor feature enhancements	GNU General Public License (GPL)	

Nagios 2.2 (2.x)
by Ethan Galstad - Fri, Apr 7th 2006 17:28 PDT

About: Nagios (formerly Netsaint) is a daemon written in C that is designed to monitor networked hosts and services.

It has the ability to notify contacts (via email, pager or other methods) when problems arise and are resolved. Host and service checks are performed by external "plugins", making it easy to write custom checks in your language of choice. Several CGIs are included in order to allow you to view the current and historical status via a Web browser, and a WAP interface is also provided to allow you to acknowlege problems and disable notifications from an internet-ready cellphone.

Changes: Fixes a segfault that could occur during flapping service notifications, a bug with writing of the retention file, and a minor bug in the availability CGI.

Remote Python Call 2.45
by ganges master - Fri, Apr 7th 2006 17:27 PDT

About: Remote Python Call (RPyC) is a Python library for distributed computing and RPC. It gives you control of a slave Python interpreter (local or remote), which works on your behalf (either synchronously or asynchronously). Unlike other RPCs, it is transparent, which means you work with remote objects as you would work with local ones. Moreover, it is symmetrical, so you can use callbacks, etc.
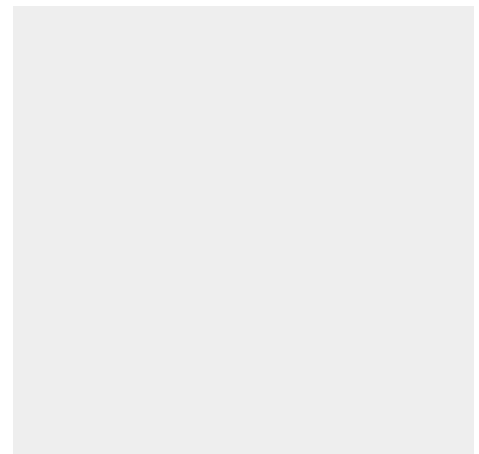

Changes: This release has cleanups and bugfix with PipeStream.write. It adds stubs for Windows, and so now works on Windows as well. Authentication support has been added: auth_server.py and AuthSocketConnection.
